

# Elements of a successful software architecture course

**David Garlan**

Len Bass and Eric Dashofy

ASEE&T 2010 ■■ March 12, 2010

# Proposed Agenda

---

- ▶ What are the core ideas of software architecture that should be taught to students?
- ▶ How is "architectural thinking" different from programming?
- ▶ What is a good architecture assignment?
- ▶ How does what you teach depend on the background of the students in the class?
- ▶ Should we be teaching software architecture at the undergraduate level?
- ▶ What should a *second* course in software architecture cover?
- ▶ What can you teach in a 3-day intensive course, for example, to industry?

# What are the core ideas of software architecture that should be taught to students?

---

- ▶ One point of reference is the CMU Architectures for Software System
  - ▶ Taught since the early 1990s at CMU in the Master in Software Engineering Course
  - ▶ Originated as an experimental course, but later recognized as a core component of professional SE education
  - ▶ Has undergone many changes over the years
  - ▶ But some things have remained constant

# What we teach now -1

---

- ▶ **General Concepts**
  - ▶ What is software architecture
  - ▶ Basic concepts: views, styles, patterns
- ▶ **Principles of Architecting**
  - ▶ Understanding architectural requirements
  - ▶ Architecture styles and tactics
  - ▶ Product lines and integration frameworks
  - ▶ From architecture to code

# What we teach now -2

---

- ▶ Architecture in Practice
  - ▶ Evaluating architectural designs
  - ▶ Handling architectural problems
  - ▶ Documenting a software architecture
  - ▶ Presenting an architecture to others
  - ▶ Architecture for X (security, usability, reliability, etc.)

# What we teach now

---

- ▶ Key concepts
  - ▶ Software architecture is distinct from programming.
  - ▶ Styles are a fundamental building block for architectural practices.
  - ▶ Understanding requirements is essential.
  - ▶ It is important to understand the link between architecture and code.
  - ▶ Notations matter. Programming languages do not matter.
  - ▶ Documentation is hard to do right, but worth the effort.
  - ▶ Quality attributes determine the success of an architecture (reliability, performance, etc.)

# What we no longer teach

---

- ▶ Module interconnection languages
- ▶ History of software engineering
- ▶ Problem frames

# What are the core ideas of software architecture that should be taught to students? *(continued)*

---

## How is "architectural thinking" different from programming?

---

- ▶ Architectural thinking is about understanding engineering tradeoffs.
- ▶ Architectural thinking is about thinking at a systems level.
- ▶ Architectural thinking requires a comprehensive understanding of multiple stakeholders' concerns

# How is "architectural thinking" different from programming? *(continued)*

---

# What is a good architectural assignment?

---

- ▶ Worth distinguishing between different kinds of assignments
  - ▶ Short single-class assignments
  - ▶ 2-week team-based architecture assignments
  - ▶ Projects
- ▶ We use all three

# The Context\*

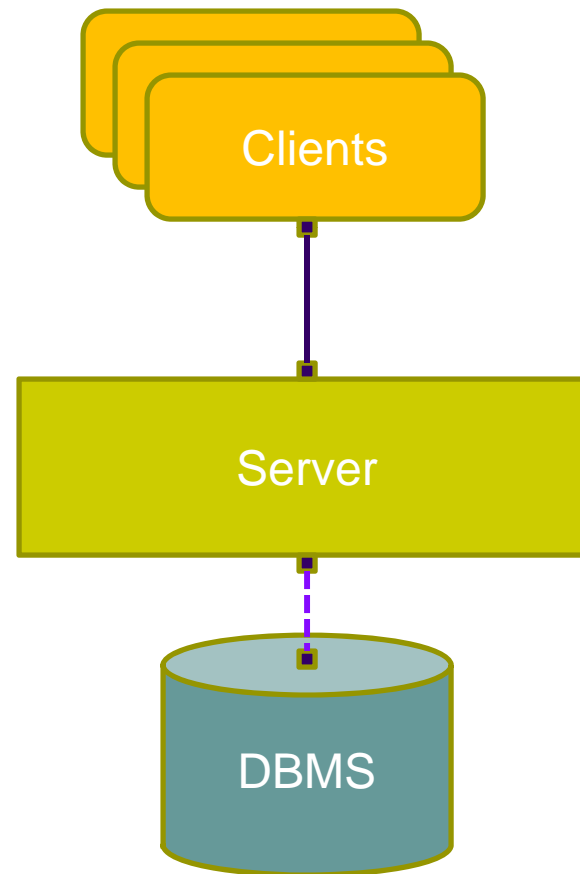

- Today you are a consultant for an organization that wants to create a web application that:
  1. Gets some data from the user
  2. Checks for validity and does some computation
  3. Stores the result so it can be accessed later
- Key functionality:
  - Must maintain a repository of user info
  - Users can update their mailing address, SSN, etc.
  - Validation involves checking things like zip code has right number of digits; zip code is consistent with the listed city, etc.
  - May be incorporated into a larger system at a later date.

\*Thanks to Ciera Jaspin

# Given “Architecture”

*Any issues with this representation?*

# The Problem

- A key concern and question from the client is where should validation be performed?
  - On the Client?
  - On the Server?
  - In the Database itself?
  - Other?

# Your task

- How would you advise your customers with regard to this system?
  - What are the important issues that your customer should be concerned with?
    - quality attributes, business concerns, technology, others...
  - How do those issues affect the architectural choice(s) for where validation is performed?
- Produce a couple of slides that explain your team's point of view and the advice you would give your customer.

# Summary

---

- ▶ Summary point 1 (perhaps by David only)
- ▶ Summary point 2 (perhaps by David only)
- ▶ ...

# Undergraduate Software Architecture Course?

---

- ▶ Do undergraduates have sufficient maturity?
- ▶ What can you *not* do with undergraduates?

# A second course in software architecture?

---

- ▶ What can one do at an advanced architecture level?
- ▶ Does this necessarily involve domain specialization?

# What can you do for industrial training?

---

- ▶ What can you hope to accomplish in a 3-day course?
- ▶ How can one best work with industry to train their engineers?
- ▶ Examples: Sony, Samsung, Xerox
